#### The NASA STI Program Office ... in Profile

Since its founding, NASA has been dedicated to the advancement of aeronautics and space science. The NASA Scientific and Technical Information (STI) Program Office plays a key part in helping NASA maintain this important role.

The NASA STI Program Office is operated by Langley Research Center, the lead center for NASA's scientific and technical information. The NASA STI Program Office provides access to the NASA STI Database, the largest collection of aeronautical and space science STI in the world. The Program Office is also NASA's institutional mechanism for disseminating the results of its research and development activities. These results are published by NASA in the NASA STI Report Series, which includes the following report types:

- TECHNICAL PUBLICATION. Reports of completed research or a major significant phase of research that present the results of NASA programs and include extensive data or theoretical analysis. Includes compilations of significant scientific and technical data and information deemed to be of continuing reference value. NASA's counterpart of peer-reviewed formal professional papers but has less stringent limitations on manuscript length and extent of graphic presentations.
- TECHNICAL MEMORANDUM. Scientific and technical findings that are preliminary or of specialized interest, e.g., quick release reports, working papers, and bibliographies that contain minimal annotation. Does not contain extensive analysis.
- CONTRACTOR REPORT. Scientific and technical findings by NASA-sponsored contractors and grantees.

- CONFERENCE PUBLICATION. Collected papers from scientific and technical conferences, symposia, seminars, or other meetings sponsored or cosponsored by NASA.
- SPECIAL PUBLICATION. Scientific, technical, or historical information from NASA programs, projects, and mission, often concerned with subjects having substantial public interest.
- TECHNICAL TRANSLATION.
   English-language translations of foreign scientific and technical material pertinent to NASA's mission.

Specialized services that complement the STI Program Office's diverse offerings include creating custom thesauri, building customized databases, organizing and publishing research results . . . even providing videos.

For more information about the NASA STI Program Office, see the following:

# **BOREAS TE-10 Leaf Optical Properties**

Stephen S. Chan, Elizabeth Middleton

# Summary

The BOREAS TE-10 team collected several data sets in support of its efforts to characterize and interpret information on the reflectance, transmittance, gas exchange, oxygen evolution, and biochemical properties of boreal vegetation. This data set describes the spectral optical properties (reflectance and transmittance) of boreal forest conifers and broadleaf tree leaves as measured with a Spectron Engineering SE590 spectroradiometer at the SSA OBS, OJP, YJP, OA, OA-AUX, YA-AUX, and YA sites. The data were collected during the growing seasons of 1994 and 1996 and are stored in tabular ASCII files.

#### 1. Data Set Overview

#### 1.1 Data Set Identification

BOREAS TE-10 Leaf Optical Properties

#### 1.2 Data Set Introduction

This data set describes the spectral optical properties (reflectance and transmittance) of included leaves and needles from boreal forest tree species as measured with a Spectron Engineering SE590 spectroradiometer at the BOReal Ecosystem-Atmosphere Study (BOREAS) Southern Study Area (SSA) Old Black Spruce (OBS), Old Jack Pine (OJP), Young Jack Pine (YJP), Old Aspen (OA), Old Aspen Auxiliary (OA-AUX), Young Aspen Auxiliary (YA-AUX), and Young Aspen (YA) sites.

#### 1.3 Objective/Purpose

The purposes of this work were to:

- Obtain a canopy profile of needle spectral optical properties.
- Examine interspecific and interseasonal differences in these parameters.
- Correlate physiological processes at the leaf/needle level with optical measurements amenable to remote sensing.
- Examine the relationships between the physiological parameters, especially photosynthesis and conductance rates, and the optical parameters (fraction of Absorbed Photosynthetically Active Radiation (fAPAR) and spectral vegetation indices (SVI)).
- Parameterize the canopy-level radiative transfer and physiological models utilized in landscape analyses by other investigators.

#### 1.4 Summary of Parameters and Variables

Hemispherical reflectance (R) and transmittance (T) factors were measured for needles of various growth years and individual leaves illuminated at near-normal incidence measured using an external light source and LI-COR LI-1800-12 integrating sphere attached to a Spectron Engineering SE590 spectroradiometer.

#### 1.5 Discussion

Hemispherical reflectance and transmittance factors of individual needles (ages: current year, previous year, 2 years ago, and up to 5 years ago growth) and broadleaf tree leaves (current year) were measured using a LI-COR LI-1800-12 Integrating Sphere attached to a Spectron Engineering SE590 spectroradiometer, and the image analysis system. The SSA sites studied were OBS, OJP, YJP, OA, OA-AUX, YA-AUX, and YA.

# 3. Theory of Measurements

Leaves, needles, and bark are canopy elements that are important in scattering radiation in boreal forest vegetation (Norman and Jarvis, 1974). Needle and bark properties can vary considerably depending on age and height in the canopy; elements deep in the canopy may be covered with algae and fungi, and shade-induced effects on shoot development may exist (Norman and Jarvis, 1974; Smith and Carter, 1988). In the near-infrared portion of the electromagnetic spectrum, little radiation is absorbed; thus, scattering by canopy elements will be significant. In contrast, leaves and needles absorb a large portion of PAR (Daughtry et al., 1989; Williams, 1991). Conifer needles absorb more PAR than deciduous leaves; twigs, especially the current year's growth, also absorb PAR (Williams, 1991). Thus, the scattering component of PAR may be small except in sparse canopies with high underlying surface albedo.

# 4. Equipment

4.1 Sensor/Instrument Description

The Spectron Engineering SE590 is a portable battery-operated spectroradiometer consisting of a CE500 data analyzer/logger controller, CE390 spectral detector head, and an external battery charger/power supply. The CE500 is a self-contained microprocessor-based controller that processes the signal from the detector head, amplifying and digitizing it with 12-bit resolution. For each spectral scan, the controller actuates the CE390 shutter, measures and stores the dark current, calculates optimum integration time, acquires the spectrum, and automatically subtracts the noise for all 256 spectral elements. Each scan was recorded individually. The entire 12-bit binary spectrum is stored in a

double-precision register until it is transmitted through the RS-232C port. The spectral detector head uses a diffraction grating as the dispersive element; the spectrum is imaged onto a 256-element photodiode array. Each element integrates simultaneously, acquiring the spectrum in a fraction of a second. The interconnect cable from the spectral head to the controller couples the spectral signals to the controller and the timing and control signals to the detector head. A shutter in the detector head, operated by the controller, closes the light path for dark current measurements. For further information, consult the SE590 operating manual. The serial numbers for the SE590s used in 1994 and 1996 are 2071 and 1051, respectively.

The LI-COR LI-1800-12 integrating sphere is an instrument for collecting radiation that has been reflected from or transmitted through a sample material. An external light source illuminates a spot on the sample. A standard light source (11.4-mm diameter) and a modified light source that restricts the illumination spot size (3.5-mm x 11-mm) were used. The lamp used in the external light source is a 6-Volt 10-Watt glass-halogen. For a further description, see the LI-COR Integrating Sphere Instruction Manual. Serial Number 2071 was used in 1994, and 1051 was used in 1996.

An image analysis system was used to measure the gaps between sample elements (e.g., needles) when a sample did not fill the entire integrating sphere sample port or a single sample element was too narrow to be completely encompassed by the modified light source.

The image analysis system included a black-and-white (B/W) charge-coupled device (CCD) video camera, a monochrome frame-grabber board, an IBM PC-compatible laptop unit with docking station, a light table, and a video monitor display with full 640 x 480 pixel spatial resolution and 256 gray levels. This system was used to determine gap fraction per sample, defined as the ratio of needle gap area to that of the total illuminated area within the aperture (round or slitted) of a precision reference template placed on a light table as viewed from above by the camera. The template, a small metal disk, was viewed alone and the area measured. Then the template was viewed with the sample on top of it and the area left uncovered by the needles was measured. The ratio of the gap area to total area makes the gap fraction. Software for image capture was "Computer Eyes/RT" (Digital Vision, Inc., Dedham, MA) and for processing was "Mocha" (SPSS, Inc., Chicago, IL). Appropriate calibration procedures were used: a) for the area of a standard template, each sample; b) for the stray light/dark current scans per measurement set; and c) for the wavelength stability of the radiometer and its spectral radiance coefficients.

A monochrome frame-grabber board (UM-08128-B) was used to input the signal from the camera into an IBM-compatible laptop computer with a docking station. SPSS Inc.'s software Mocha ver. 2.0 was used to measure the areas of the incident light source beams and gaps. The display monitor was an IBM VGA with 640- by 480-pixel resolution.

#### 4.1.1 Collection Environment

The vertical profile of the canopy was divided into three layers: top, middle, and bottom. Measurements were taken at the SSA OBS (Picea mariana), OJP (Pinus banksiana and Apocynum androsaemifolium), YJP (Pinus banksiana), YA (Populus tremuloides and Corylus cornuta Marsh), OA (Populus tremuloides and Corylus cornuta Marsh), OA-AUX (Populus tremuloides and Corylus cornuta Marsh), and YA-AUX (Populus tremuloides and Corylus cornuta Marsh and Picea glauca). At the OBS, OA, OA-AUX, and OJP sites, sample collection was made from canopy access towers constructed onsite by BOREAS staff. At the YJP, YA, and YA-AUX sites, collection was accomplished from the ground. Collection of hazelnut understory was also accomplished from the ground. In 1994, data were obtained during three discrete measurement periods (1 to 2 days each period) designated by BOREAS as Intensive Field Campaigns (IFCs) (IFC-1, -2, -3). In 1994, these IFCs were selected to measure parameters at bud breaks and leaf expansion (24-May to 12-Jun), during midsummer or peak growing season (26-Jul to 08-Aug) and at the onset of dormancy or senescence in autumn (30-Aug to 15-Sep). In 1996, collection dates did not necessarily coincide with any official IFCs. In 1994, the samples were measured individually. The period of measurement in 1996 was during July. On collection/observation day 14-Jul-1996, the 1992 and 1993 samples were combined and the 1994 and 1995 samples were combined. Branch tips measured were excised from the trees and sealed in plastic bags with moist towels. After collection, samples were refrigerated until the measurements were conducted in the room-temperature field laboratory.

#### 4.1.2 Source/Platform

During these measurements, the spectroradiometer and the integrating sphere were mounted on a tripod in the laboratory.

# 4.1.3 Source/Platform Mission Objectives

Not applicable.

#### 4.1.4 Key Variables

Adaxial and abaxial spectral reflectance and transmittance. For both broadleaves and conifer needles, the designation of foliar surfaces as either adaxial (dorsal or upper) or abaxial (ventral or underside) is made on an anatomical basis (Esau, 1977). For broadleaves (both dicots and monocots), the adaxial (dorsal) surface is the one adjacent to the palisade mesophyll layer, and the abaxial (ventral) surface is adjacent to the spongy mesophyll layer. For conifers, the adaxial surface is the flat (or less curved) facet whose surface lies closest to the xylem at the needle core, while the abaxial surface is the typically more curved and opposite facet whose surface lies closest to the phloem at the needle core.

#### 4.1.5 Principles of Operation

The SE590 spectral detector head uses a diffraction grating as the dispersive element; the spectrum is imaged onto a 256-element photodiode array. Each element integrates simultaneously, acquiring the spectrum in a fraction of a second.

The LI-COR LI-1800-12 integrating sphere is an external integrating sphere, which means that the sample is external to the sphere; when the sample is in place, a small part of the sample actually makes up part of the sphere wall. For further information, see the LI-COR 1800-12 Integrating Sphere Instruction Manual.

The CCD camera transmits a signal to the frame-grabber board, which translates the intensity of each pixel to a gray scale from 0 (black) to 255 (white) levels. The Mocha software program was set up to count the number of pixels in a defined area of interest for a range of gray scales that represent the "white" gaps between the sample elements. The white threshold was determined by adjusting the threshold so that a standard size (area) reference template actually registered the correct area.

### 4.1.6 Sensor/Instrument Measurement Geometry

All instrumentation took place under laboratory conditions. The SE590 was mounted on top of the LI-COR LI-1800-12 integrating sphere. A tripod was attached to the support connecting the SE590 and integrating sphere. A modified external light source with a slitted beam (3.5 mm x 11 mm) was used to illuminate narrow samples and associated reference. A standard external light source with a circular beam (11.4-mm diameter spot size) was used to illuminate all other samples and associated reference. The light source was kept in a horizontal position according to integrating sphere manual requirements.

#### 4.2 Calibration

Appropriate calibration procedures were used: a) for the area of a standard template, each sample; b) for the stray light/dark current scans per measurement set; and c) for the wavelength stability of the radiometer and its spectral radiance coefficients.

#### 4.2.1 Specifications

Each SE590 has a unique wavelength associated with each of its 252 bands. A cubic spline interpolation was applied to the 252 bands to standardize the wavelengths to every 5 nm from 400 to 1000 nm, so that wavelength-to-wavelength comparisons can be made among SE590s.

#### 4.2.1.1 Tolerance

None given.

#### 4.2.2 Frequency of Calibration

The SE590s were calibrated against Hg and Ar vapor lamps before and after each IFC or collection session.

#### 4.2.3 Other Calibration Information

**For 1994:** Wavelengths, in nanometers, and their corresponding channels (ch), used for data reduction. Wavelength Characterization (nm) for BOREAS Terrestrial Ecology (TE)-10 SE590 on 31-May-1994 by NASA GSFC (SE590 serial number 2071):

# 5. Data Acquisition Methods

Measurements were made on aspen and hazelnut leaves obtained from the upper and lower canopy layers of the tree overstories. At the sites, branches were accessed from canopy access towers erected by BOREAS staff. Stray light was measured at the beginning of each day and/or with each light source used. The color of the leaves was coded using the Munsell color chips (Munsell, 1977) prior to optical measurements. The method of sample measurement is described below:

The sample element filled the integrating sphere sample port. Procedures for optical property measurements are described by Daughtry et al. (1989). Individual leaves or stems were cut from the plant. The needles remained attached to the stem during the measurement. Each leaf or needles measured was inserted into the integrating sphere sample port with the adaxial (top) surface facing the inside of the sphere. Three measurements followed:

- light reflected from the reference for the adaxial surface
- light reflected from the adaxial surface
- light transmitted through the abaxial (bottom) surface

The sample was removed from the sample port and reinserted so that the abaxial surface faced the inside of the sphere; the sample was arranged so that the same portion of the sample was measured. Three additional measurements followed:

- light transmitted through the adaxial surface
- light reflected from the abaxial surface
- light reflected from the reference for the abaxial surface

All samples were illuminated with the standard external light source. Because of the difficulty in measuring needle samples, some transmittance values in the visible spectrum were calculated to be negative and were not indicative of true values. The methodology used for correcting the transmittance values is given in Section 9.1.1. For further information and indepth explanation regarding transmittance correction technique, please refer to Middleton et al. (IGARSS 1996).

#### 6. Observations

# **6.1 Data Notes** None given.

# **6.2 Field Notes**None given.

# 7. Data Description

# 7.1 Spatial Characteristics

#### 7.1.1 Spatial Coverage

Samples were taken from the top, middle, and bottom of the canopy as indicated in the CANOPY\_LOCATION parameter in the data sets. The OJP, OA, and OBS samples were obtained with the aid of canopy access towers located at the OJP, OA, OA-AUX, and OBS sites. The SSA measurement sites and associated North American Datum of 1983 (NAD83) coordinates are:

- OBS canopy access tower located at the flux tower site, site id G8I4T, Lat/Long: 53.98717 N, 105.11779 W, Universal Transverse Mercator (UTM) Zone 13, N:5,982,100.5 E;492,276.5.
- OA canopy access tower located 100 m up the path to the flux tower site, site id C3B7T, Lat/Long: 53.62889 N, 106.19779 W, UTM Zone 13, N:5,942,899.9 E:420,790.5.
- OA-AUX was the canopy access tower located by the trailhead/parking area for the path leading to the flux tower at site id C3B7T, Lat/Long: 53.62889 N, 106.19779 W, UTM Zone 13, N:5,942,899.9 E:420,790.5. This SSA-OA-AUX site was farther up the path than SSA-OA from the flux tower site.
- OJP canopy access tower flux tower site, site id G2L3T, Lat/Long: 53.91634 N, 104.69203 W, UTM Zone 13, N:5,974,257.5 E:520,227.7.
- YA canopy access tower, site id D0H4T, Lat/Long: 53.65601 N, 105.32314 W, UTM Zone 13, N:5,945,298.9, E:478,644.1.
- YJP near flux tower site, site id F8L6T, Lat/Long: 53.87581 N, 104.64529 W, UTM Zone 13, N:5,969,762.5 E:523,320.2.
- YA-AUX site id D6H4A, Lat/Long: 53.708 N, 105.315 W, UTM Zone 13, N: 5,951,112.1 E: 479,177.5 near the Snow Castle Lodge.

Please note that at YA-AUX black spruce, jack pine, aspen, balsam fir, balsam poplar, tamarack, hazelnut, and several other shrub and herbaceous species were also present.

#### 7.1.2 Spatial Coverage Map

Not available.

#### 7.1.3 Spatial Resolution

The measurements were obtained from single leaves and needles collected from sample trees near the coordinates given in Section 7.1.1.

#### 7.1.4 Projection

Not applicable.

#### 7.1.5 Grid Description

Not applicable.

#### 7.2 Temporal Characteristics

Preparation for measurement took 5 minutes per broadleaf sample and 10 minutes per conifer sample. The measurements for each sample took under 5 minutes. Samples were stored for 2 to 3 hours in the refrigerator.

#### 7.2.1 Temporal Coverage

In 1994, data were collected from 24-May to 15-Sep. In 1996, data were collected from 11-Jul to 16-Jul.

# 7.2.2 Temporal Coverage Map

Samples were collected from 8:00 a.m. to 3:00 p.m. on the following days in 1994:

Site	IFC-1	IFC-2	IFC-3
SSA-OBS	02-Jun-1994	29-Jul-1994	15-Sep-1994
SSA-OJP	01-Jun-1994	23-Jul-1994	08-Sep-1994
SSA-YJP	28-May-1994	23-Jul-1994	09-Sep-1994
SSA-YA-AUX	N/A	31-Jul-1994	12-Sep-1994
SSA-OA	24-May-1994	20-Jul-1994	14-Sep-1994
	29-May-1994		
	09-Jun-1994		
SSA-YA	25-May-1994	29-Jul-1994	01-Sep-1994
	03-Jun-1994		11-Sep-1994
SSA-OA-AUX	N/A	20-Jul-1994	01-Sep-1994

For 1996: Samples were collected from 8:00 a.m. to 3:00 p.m. on the following days in 1996:

Site	Dates	
SSA-OBS	15-Jul-1996	
SSA-OJP	12-Jul-1996	
SSA-YJP	13-Jul-1996	and 16 Jul-1996
SSA-YA-AUX	11-Jul-1996	

# 7.2.3 Temporal Resolution

None given.

# 7.3 Data Characteristics

# 7.3.1 Parameter/Variable

The parameters contained in the data files on the CD-ROM are:

Column Name
SITE NAME
<del>_</del>
SUB_SITE
DATE_OBS
SPECIES
SAMPLE_GROWTH_YEAR
CANOPY_LOCATION
NUM_OBS
WAVELENGTH
MEAN_ADAXIAL_REFL
SDEV_ADAXIAL_REFL
MEAN_ADAXIAL_TRANS
SDEV_ADAXIAL_TRANS
MEAN_ABAXIAL_REFL
SDEV_ABAXIAL_REFL
MEAN_ABAXIAL_TRANS
SDEV_ABAXIAL_TRANS
CRTFCN_CODE
REVISION_DATE

**7.3.2 Variable Description/Definition**The descriptions of the parameters contained in the data files on the CD-ROM are:

Column Name	Description
SITE_NAME	The identifier assigned to the site by BOREAS, in the format SSS-TTT-CCCCC, where SSS identifies the portion of the study area: NSA, SSA, REG, TRN, and TTT identifies the cover type for the site, 999 if unknown, and CCCCC is the identifier for site, exactly what it means will vary with site type.
SUB_SITE	The identifier assigned to the sub-site by BOREAS, in the format GGGGG-IIIII, where GGGGG is the group associated with the sub-site instrument, e.g. HYD06 or STAFF, and IIIII is the identifier for sub-site, often this will refer to an instrument.
DATE_OBS	The date on which the data were collected.
SPECIES	Botanical (Latin) name of the species (Genus species).
SAMPLE_GROWTH_YEAR	The year in which the collected sample first grew.
CANOPY_LOCATION	Location in the canopy from which the sample was taken.
NUM_OBS	Number of observations of the given sample used to calculate given values.
WAVELENGTH	Spectral wavelength at which measurement was acquired.
MEAN_ADAXIAL_REFL	The mean reflectance of the adaxial surface of sample.
SDEV_ADAXIAL_REFL	Standard deviation of reflectance of the adaxial surface of sample.
MEAN_ADAXIAL_TRANS	The mean transmittance of the adaxial surface of the sample. The adaxial surface was illuminated during measurements.
SDEV_ADAXIAL_TRANS	Standard deviation of transmittance through the adaxial surface of sample.
MEAN_ABAXIAL_REFL	Mean reflectance of the abaxial surface of sample.
SDEV_ABAXIAL_REFL	Standard deviation of reflectance of the abaxial surface of sample.
MEAN_ABAXIAL_TRANS	The mean transmittance of the abaxial surface of the sample. The abaxial surface was illuminated during measurements.
SDEV_ABAXIAL_TRANS	Standard deviation of reflectance through the abaxial surface of sample.
CRTFCN_CODE	The BOREAS certification level of the data.  Examples are CPI (Checked by PI), CGR (Certified by Group), PRE (Preliminary), and CPI-??? (CPI but questionable).
REVISION_DATE	The most recent date when the information in the referenced data base table record was revised.

# 7.3.3 Unit of Measurement

The measurement units for the parameters contained in the data files on the CD-ROM are:

Column Name	Units
SITE_NAME	[none]
SUB_SITE	[none]
DATE_OBS	[DD-MON-YY]
SPECIES	[none]
SAMPLE_GROWTH_YEAR	[unitless]
CANOPY_LOCATION	[none]
NUM_OBS	[counts]
WAVELENGTH	[micrometers]
MEAN_ADAXIAL_REFL	[percent]
SDEV_ADAXIAL_REFL	[percent]
MEAN_ADAXIAL_TRANS	[percent]
SDEV_ADAXIAL_TRANS	[percent]
MEAN_ABAXIAL_REFL	[percent]
SDEV_ABAXIAL_REFL	[percent]
MEAN_ABAXIAL_TRANS	[percent]
SDEV_ABAXIAL_TRANS	[percent]
CRTFCN_CODE	[none]
REVISION_DATE	[DD-MON-YY]

# 7.3.4 Data Source

The sources of the parameter values contained in the data files on the CD-ROM are:

Column Name	Data Source			
SITE NAME	[BORIS Designation]			
<del>_</del>	_			
SUB_SITE	[BORIS Designation]			
DATE_OBS	[Human Observer]			
SPECIES	[Human Observer]			
SAMPLE_GROWTH_YEAR	[Human Observer]			
CANOPY_LOCATION	[Human Observer]			
NUM_OBS	[Human Observer]			
WAVELENGTH	[Laboratory Equipment]			
MEAN_ADAXIAL_REFL	[Laboratory Equipment]			
SDEV_ADAXIAL_REFL	[Laboratory Equipment]			
MEAN_ADAXIAL_TRANS	[Laboratory Equipment]			
SDEV_ADAXIAL_TRANS	[Laboratory Equipment]			
MEAN_ABAXIAL_REFL	[Laboratory Equipment]			
SDEV_ABAXIAL_REFL	[Laboratory Equipment]			
MEAN_ABAXIAL_TRANS	[Laboratory Equipment]			
SDEV_ABAXIAL_TRANS	[Laboratory Equipment]			
CRTFCN_CODE	[BORIS Designation]			
REVISION_DATE	[BORIS Designation]			

#### 7.3.5 Data Range

The following table gives information about the parameter values found in the data files on the CD-ROM.

	Minimum	Maximum	Missing	Unrel	Below	Data
	Data	Data	Data	Data	Detect	Not
Column Name	Value	Value	Value	Value	Limit	Cllctd
SITE_NAME	SSA-90A-FLXTR	SSA-YJP-FLXTR	None	None	None	None
SUB_SITE	9TE10-LF001	9TE10-LF002	None	None	None	None
DATE_OBS	25-MAY-94	14-JUL-96	None	None	None	None

REVISION_DATE	22-JUL-98	24-JUL-98	None	None	None	None
	<del></del>					

Minimum Data Value -- The minimum value found in the column.

Maximum Data Value -- The maximum value found in the column.

Missing Data Value -- The value that indicates missing data. This is used to indicate that an attempt was made to determine the parameter value, but the attempt was unsuccessful.

Unrel Data Value -- The value that indicates unreliable data. This is used to indicate an attempt was made to determine the

parameter value, but the value was deemed to be unreliable by the analysis personnel

unreliable by the analysis personnel.

Below Detect Limit -- The value that indicates parameter values below the

instruments detection limits. This is used to indicate that an attempt was made to determine the parameter value, but the analysis personnel determined that the parameter value was below the detection

limit of the instrumentation.

Data Not Cllctd -- This value indicates that no attempt was made to

determine the parameter value. This usually indicates that BORIS combined several similar but not identical data sets into the same data base table

but this particular science team did not

measure that parameter.

Blank -- Indicates that blank spaces are used to denote that type of value. N/A -- Indicates that the value is not applicable to the respective column.

None -- Indicates that no values of that sort were found in the column.

\_\_\_\_\_\_

#### 7.4 Sample Data Record

The following are wrapped versions of data record from a sample data file on the CD-ROM.

```
SITE_NAME, SUB_SITE, DATE_OBS, SPECIES, SAMPLE_GROWTH_YEAR, CANOPY_LOCATION, NUM_OBS, WAVELENGTH, MEAN_ADAXIAL_REFL, SDEV_ADAXIAL_REFL, MEAN_ADAXIAL_TRANS, SDEV_ADAXIAL_TRANS, MEAN_ABAXIAL_REFL, SDEV_ABAXIAL_REFL, MEAN_ABAXIAL_TRANS, SDEV_ABAXIAL_TRANS, CRTFCN_CODE, REVISION_DATE

# 8. Data Organization

#### 8.1 Data Granularity

The smallest unit of data tracked by the BOREAS Information System (BORIS) was the data collected at a given site on a given date.

#### **8.2 Data Format(s)**

The Compact Disk-Read-Only Memory (CD-ROM) files contain American Standard Code for Information Interchange (ASCII) numerical and character fields of varying length separated by commas. The character fields are enclosed with single apostrophe marks. There are no spaces between the fields.

Each data file on the CD-ROM has four header lines of Hyper-Text Markup Language (HTML) code at the top. When viewed with a Web browser, this code displays header information (data set title, location, date, acknowledgments, etc.) and a series of HTML links to associated data files and related data sets. Line 5 of each data file is a list of the column names, and line 6 and following lines contain the actual data.

# 9. Data Manipulations

#### 9.1 Formulae

In the formulas below, for leaf samples, the leaf would cover the whole area of the aperture resulting in a zero gap fraction and negating that term in the equation.

For 1994, these formulae were used for both conifers and broadleafs:

where: Fr = flux measured in reflectance mode

Ft = flux measured in transmittance mode

Fn = flux measured in reflectance mode with no sample

Fwr, Fwt = flux measured in reference mode for side of leaf illuminated during eflectance and transmittance measurements, respectively

 $Rr = reflectance of BaSO_4 reference surface$ 

G3 = function of sphere reflectance and geometry and sample reflectance

For 1996, these formulae were used for both conifers and broadleafs:

#### **REFLECTANCE**

#### TRANSMITTANCE

where: GF gap fraction

RC corrected reflectance

RFB observed reference standard bottom (adaxial)

RFT observed reference standard top (abaxial)

RB observed reflectance bottom (side of needle surface)

RT observed reflectance top (side of needle surface)

STR observed stray light in reflectance mode

TC corrected transmittance

TB observed transmittance bottom (side of needle surface)

TT observed transmittance top (side of needle surface)

w observed sphere wall reflectance

#### 9.1.1 Derivation Techniques and Algorithms

The corrected transmittance is a function of three parameters: the original calculated transmittance, gap fraction, and slope.

#### CALIBRATION DATA SET

In order to obtain values for the slope parameter, calibration data sets of conifer needles were taken in 1994 and 1996 at the sites in the SSA, located in the general vicinities of Candle Lake and Nipowan, Saskatchewan, Canada. Optical properties of the needles were then measured with varying gap fractions. Calibration data sets were compiled using gap fractions varying from approximately 0%-45%. The spectral regions associated with the greatest absorption (e.g., chlorophyll) were found to be most affected: negative transmittances were calculated in the visible for virtually all gap fractions, for these needles.

#### **GAP FRACTION**

Unlike broadleaves, conifer needles are unable to occupy the entire aperture of the measuring device. Therefore, a certain percentage of energy is allowed to pass beyond the sample to the measuring device, without being disturbed by the physical properties of the needle. This percentage is the gap fraction parameter, which is the percentage of aperture uncovered by needles. Gap fraction was calculated for all the conifer needle samples. Preliminary analysis suggested that the effect of the gap fraction on leaf optical properties was a function of energy wavelength. In other words, gap fraction affected properties at higher percentages in the visible spectrum than in the near-infrared spectrum, implying the need for another parameter.

#### SLOPE for 1994

In order to obtain values for the slope parameter, a calibration data set of conifer needles was taken at sites in the SSA. Optical properties of the needles were then measured with varying gap fractions and similar techniques as used for the three IFCs. The spectral regions associated with the greatest absorption (e.g., chlorophyll) were found to be most affected: negative transmittance were calculated in the visible for virtually all gap fractions, for these needles. The measured transmittance is linearly related to gap fraction, and the regression coefficients of these relationships was used as the slope parameter.

#### SLOPE for 1996

Slope is calculated by using the transmittance data from the calibration data sets. The measured transmittance is linearly related to gap fraction, and the regression coefficients of these relationships was used as the slope parameter. It was deemed unnecessary to use any correction below a 17% gap fraction.

#### CORRECTED TRANSMITTANCE

The corrected transmittance values were then calculated as the product of gap fraction and slope, subtracted from the original calculated transmittance.

(Corrected T) = (Measured T) - (Gap Fraction \* Slope) [11]

#### 9.2 Data Processing Sequence

#### 9.2.1 Processing Steps

None given.

# 9.2.2 Processing Changes

None given.

#### 9.3 Calculations

None given.

#### 9.3.1 Special Corrections/Adjustments

Because different procedures were used in 1996 by the instrument operator, a correction was applied to the 1996 black spruce data to make them consistent with all the other data collected in 1994 and 1996. During all but the 1996 black spruce collection sessions, the integrating sphere was empty during referencing procedures. In 1996, an empty sample holder was in place on the integrating sphere at all times, including when the initial reference measurements were made.

Having the empty sample holder in place during the initial referencing procedures in the 1996 black spruce sessions resulted in a reduction of black spruce reflectance values. This affected the black spruce data due to the very small needle size which necessitated the use of the sample holder with the slitted aperture. To normalize the 1996 black spruce data with the other data collected in 1994 and 1996, an offset value was calculated by using a ratio of stray light from the wall (STRW) to the stray light from the sample (STRS), which was then applied to the data. The offset value for black spruce was calculated by:

```
(STRW/STRS ratio of 1996 jack pine data)
----- = offset for 1996 black spruce data [12]
(STRW/STRS ratio of 1996 black spruce data)
```

#### 9.3.2 Calculated Variables

None given.

#### 9.4 Graphs and Plots

None given.

#### 10. Errors

#### 10.1 Sources of Error

During the 1996 summer collection session, a slightly different data acquisition methodology was used which resulted in a reduction of black spruce reflectance values. An empty sample holder was in place within the integrating sphere at all times, including during the initial reference-taking steps. Previously, the sample holder was absent while referencing. This affected only the black spruce data because of the very small needle size, which necessitated the use of the sample holder with the slitted aperture. To normalize the 1996 summer session black spruce data with the other data from 1994 and 1996, an offset value was calculated by using a ratio of the STRW/STRS from the 1996 black spruce data and the STRW/STRS from the 1996 jack pine data, which was then applied to the data. The offset was calculated using:

```
(STRW/STRS ratio of 1996 jack pine data)
----- = offset for 1996 black spruce data [12]
(STRW/STRS ratio of 1996 black spruce data)
```

#### 10.2 Quality Assessment

#### **10.2.1 Data Validation by Source**

Comparisons were made with other BOREAS results and with published results.

#### 10.2.2 Confidence Level/Accuracy Judgment

In 1994, the methods used during IFC-1 produced some minor distortions in the data that were not totally eliminated by postcollection processing, resulting in an 80% confidence level in IFC-1 data. Revisions in techniques and streamlining of sample collection and measurement methods were implemented as needed. These occurred mainly during IFC-1, which acted as TE-10's learning phase. Therefore, confidence in IFC-2 and IFC-3 data is much stronger, with a degree of reliability greater than 90%.

#### **10.2.3 Measurement Error for Parameters**

None given.

#### 10.2.4 Additional Quality Assessments

Calculated results were plotted, and the plots were compared with those from published papers.

# 10.2.5 Data Verification by Data Center

Data were examined for general consistency and clarity.

#### 11. Notes

#### 11.1 Limitations of the Data

None given.

#### 11.2 Known Problems with the Data

Because of the difficulty in measuring needle samples, some transmittance values in the visible spectrum measured negative and were not indicative of true values.

#### 11.3 Usage Guidance

None given.

#### 11.4 Other Relevant Information

In 1996, the small size and quantity of black spruce needles present on the trees sampled, because of low production, necessitated combining two age classes of needles in several instances to achieve a large enough sample size.

Acknowledgment of other research staff who assisted in this study: Scott K. Mitchell, UMD Undergraduate Student; Robert J. Rusin, UMD Undergraduate Student; David A. Shirey, UMD Graduate Student

# 12. Application of the Data Set

This data set will be of interest to investigators undertaking data comparisons and integrations, and parameterization or validation of canopy models requiring leaf-level optical information at these and similar sites.

#### 13. Future Modifications and Plans

None given.

#### 14. Software

#### **14.1 Software Description**

Computer Eyes /RT (Digital Vision, Inc., Dedham, MA) Custom software developed by M.A. Mesarch of UNL Excel 5.0 for Windows (Microsoft) Mocha (SPSS, Inc., Chicago, IL) Systat 6.0 (SPSS, Inc., Chicago, IL)

#### 14.2 Software Access

None given.

#### 15. Data Access

The leaf optical properties data are available from the Earth Observing System Data and Information System (EOSDIS) Oak Ridge National Laboratory (ORNL) Distributed Active Archive Center (DAAC).

#### 15.1 Contact Information

For BOREAS data and documentation please contact:

ORNL DAAC User Services Oak Ridge National Laboratory P.O. Box 2008 MS-6407 Oak Ridge, TN 37831-6407

Phone: (423) 241-3952 Fax: (423) 574-4665

E-mail: ornldaac@ornl.gov or ornl@eos.nasa.gov

#### 15.2 Data Center Identification

Earth Observing System Data and Information System (EOSDIS) Oak Ridge National Laboratory (ORNL) Distributed Active Archive Center (DAAC) for Biogeochemical Dynamics http://www-eosdis.ornl.gov/.

#### 15.3 Procedures for Obtaining Data

Users may obtain data directly through the ORNL DAAC online search and order system [http://www-eosdis.ornl.gov/] and the anonymous FTP site [ftp://www-eosdis.ornl.gov/data/] or by contacting User Services by electronic mail, telephone, fax, letter, or personal visit using the contact information in Section 15.1.

#### 15.4 Data Center Status/Plans

The ORNL DAAC is the primary source for BOREAS field measurement, image, GIS, and hardcopy data products. The BOREAS CD-ROM and data referenced or listed in inventories on the CD-ROM are available from the ORNL DAAC.

# 16. Output Products and Availability

### **16.1 Tape Products**

None.

#### 16.2 Film Products

None.

#### **16.3 Other Products**

These data are available on the BOREAS CD-ROM series.

# 18. Glossary of Terms

Abaxial: The ventral or underside of leaf or needle.

Adaxial: The dorsal or upper of leaf or needle.

Channel (ch): One band on the SE590, each having a unique wavelength. Gap fraction: The percentage of aperture not covered by needles.

Reflectance (R): Light shines on the specified surface, bounces off this

surface, and then bounces around in the integrating sphere; the spectroradiometer then measures the integrated light that

is bouncing around in the sphere.

STRS: Stray light from the sample. STRW: Stray light from the wall.

Transmittance (T): Light shines on the specified surface, goes through the

needle, and then passes into the integrating sphere; the spectroradiometer then measures the integrated light that is

bouncing around in the sphere.

#### 13. ABSTRACT (Maximum 200 words)

The BOREAS TE-10 team collected several data sets in support of its efforts to characterize and interpret information on the reflectance, transmittance, gas exchange, oxygen evolution, and biochemical properties of boreal vegetation. This data set describes the spectral optical properties (reflectance and transmittance) of boreal forest conifers and broadleaf tree leaves as measured with a Spectron Engineering SE590 spectroradiometer at the SSA OBS, OJP, YJP, OA, OA-AUX, YA-AUX, and YA sites. The data were collected during the growing seasons of 1994 and 1996 and are stored in tabular ASCII files.
